- 
- a Continuing families' values at intake are significantly different ( $p < .05$ ) than new families' values at intake (based on independent t-tests).
  - b Continuing families' values at outcome are significantly different ( $p < .05$ ) than new families' values at outcome (based on independent t-tests).
  - c Intake values are significantly different ( $p < .05$ ) than outcome values within the category (based on paired t-test).
  - d Participants were not asked this question until the 1999-2000 program year.
